Keep in mind that this book covers all the latest updates to Photoshop CS6. CS6 includes three new versions of Photoshop (2010 for desktop, 2013 for Macintosh, and 2014 for Windows). The most recent version, CS6, is also known as Photoshop CC. This edition is especially geared to designers and is probably the version you would choose if you are a typical professional artist. However, Photoshop CS5 or CS5.5 is still a very capable version for those who are not necessarily professional designers and who are instead working on a small or medium-sized business. (You will learn more about Photoshop in Book I, Chapter 5.) In the following sections, I guide you through the four major tabs that make up the Photoshop workspace. When you open Photoshop, it displays a screen similar to the one in Figure 1-1. It's the main window where you do all your image editing. If you close the Photoshop window, you are no longer editing your image; you have simply saved the current state of the image. Here are the main components of the Photoshop window:

Figure 1-1: The Photoshop window.

- 1. Library: It is the central point of the Photoshop workspace and contains all the images and documents you've created or imported. To the left of the Library is a stack containing your recent projects.
- 2. Layers: Each layer in your image is its own separate entity. You can create as many layers as you like and then use the various tools to manipulate those layers. When you create a new layer, it appears in the bottom part of the canvas.
- 3. Photoshop panel: The Photoshop panel is the space on the right side of the window. It contains the entire undo history of your recent actions, as well as the individual layer tools, layer modes, masks, the brush tools, and the measurement tools. You can use this space to do your editing in a variety of ways – see Chapter 10 for more about using the Photoshop panel.
- 4. History: In the upper-right corner of the Photoshop workspace, you can see an area just below the menu bar. The History panel is where all the past changes you have made to your image are stored. The History panel is a working area that contains a list of all the recent edit actions you have performed. You can click on any action in the list to preview the edit. You can also apply a Photoshop action to your image. (Book IV, Chapter 1 covers

Q: How to move back to the previous activity after swipe I have a problem with my activity I have added a variable named myCurrentPosition which gets an int value that is equal to the number of tabs that are in the page. When a user swipes to next page, I want the myCurrentPosition to be reset to 0 I've tried View Pager from: and I think I need to calculate the position of the next tab with the swipe. How can I do this? A: Override getItemAtPosition and move back there when the new page is selected. Documentation: Q: Has Apple finished its Safari HTML5 and CSS3 support? I'm currently playing with the new element/property values in HTML5 and some of the CSS3 properties. I noticed that browsers are still working to support the new features, e.g. the ::-webkit-scrollbar{ width: 6px; } line in CSS3 for making scrollbars was not supported in Firefox until recently. Apple dev team has announced that they are finishing their support of CSS3 and HTML5 in its Safari browser. Does this mean that they have finished supporting these new features in their browsers as well? A: Yes, it means they have completed their work for that version of Safari. Because of the nature of web technology, it is not possible to accurately predict exactly when features will be available to browsers. As for Apple's announcement, it is important to note that they are including features that are widely supported, but not by all browsers. Microsoft's Internet Explorer has not even released an update to include this feature yet. So, because of this, you may have a web site that looks perfectly acceptable in Safari on Apple products, but looks funny in Firefox. It is unfortunate, but it is not uncommon.

Native Script 2.1 now supports iOS 8 - mcphage ===== mcphage Regarding the new build(s) system:

- \- It's supposed to be faster, but that depends on the underlying platform
- \- You should not have to use "tns run" to get to a build, unless the environment is uncooperative
- \- There are some special cases and test cases that aren't handled by the new system, such as packaging an app that contains custom framework libraries, which is just a linker issue
- \- Current build scripts should work as-is
- \- On the plus side, it does mean you get to actually see what's running on the target device, and not what's in the CLI log (there is a log file)
- \- If you're on a Windows machine, you should be able to double-click on `.app` files to launch them
- \- You can also just specify a directory as the build script, if you'd prefer (i.e. type "npm run" with the directory)
